in vivo diagnostic agents and for raising antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is M. tuberculosis MSL antigenic protein. MSL is also referred to as MTB9.8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to fusion proteins containing at least two mycobacterium species antigens, nuclectides encoding them and compositions comprising such fusion proteins. The present invention particularly relates to nucleic acids encoding fusion proteins that include two or more individual M. tuberculosis antigens which increase the serological sensitivity of sera from individuals infected with tuberculosis and methods for their use in diagnosis, prevention are useful for eliciting an immune response in a mammal, e.g., human, immunised with BCG. They are useful in the diagnosis, treatment and prevention of Mycobacterium infection. The fusion proteins and the polynucleotides are useful as diagnosit coll in patients infected with Mycobacterium, in vitro and in vivo assays for detecting humaral antibodies or cell-mediated immunity against M. tuberculosis, for the

ö
diagnosis of an infection or monitoring of disease progression, as immunogens to generate or elicit a protective immune response in a patient and for raising anti-M. tuberculosis antibodies in a non-human animal. Sequences of the invention are also used as vaccines. MTB32A fusion proteins of the invention are useful as in vivo diagnostic agents for intradermal skin test. The present sequence is M. tuberculosis MTB9.8
                                                                                                                                                                                                                                                                                                                              1 MSLLDAHIPQLVASQSAFAAKAGLMRHTIGQAEQAAMSAQAFHQGESSAAFQAAHARFVA 60
                                                                                                                                                                                                                                                                                                                                                                          9

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide. The recombinant nucleic acid comprises a heterologous bolynucleotide sequence encoding an antigen or an antigenic fragment from Mycobacterium sp. and a Leishmania polynucleotide sequence encoding a polypeptide or its fragment. The Leishmania polynucleotide is selected from TSA, LeIF, M15, and 6H polynucleotides. Sequences of the invention are used in methods for eliciting immune response in mammals. They are useful as vaccines to eliciting immune response in mammals. They are microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion
                                                                                                                                                                                                                                                                                                   New recombinant nucleic acid molecule comprising a Leishmania TSA, LeIF, MI5 or 6H polynuclectide, useful as vaccine to elicit protective immunity against pathogenic microorganisms e.g. Leishmania and Mycobacterium tuberculosis.
for the 3 antigens. The invention provides fusion proteins (see AAY32059-71) containing at least 2 M. tuberculosis antigens. The new fusion proteins and polymuclectides encoding them are useful as vaccines for preventing tuberculosis (claimed), for diagnosis (via in vitro assays or intradermal skin tests for detection of anti-M. tuberculosis antibodies), monitoring of disease progression, and treatment of tuberculosis antibod are more effective immunogens than mixtures of the individual protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Vaccine, immunity, diagnostic agent, gene therapy, DPV-MII-MSL-MICC#2, MTb71F; MTB8.4, MTB9.9A, MTB9.8, MTB41, fusion protein.

polypeptides are used for enhancing the expression of polynucleotides, as in twive diagnostic agents and for raising antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is MTb71F fusion protein. This fusion protein comprises DPV (MTB8.4)-MTI (MTB9.48) MSI (MTB9.8) protein sequences from M. tuberculosis and MTCC#2 (MTB41) protein from Mycobacterium sp. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                              189 MSLLDAHIPQLVASQSAFAAKAGLMRHTIGQAEQAAMSAQAFHQGESSAAFQAAHARFVA 248
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to fusion proteins containing at least two Mycobacterium species antigens, nucleotides encoding them and compositions comprising such fusion proteins. The present invention particularly relates to nucleic acids encoding fusion proteins that include two or more individual M. tuberculosis antigens which increase the serological sensitivity of sera from individuals infected with tuberculosis and methods for their use in diagnosis, prevention and treatment of tuberculosis infection. Sequences of the invention are immunised with BGC. They are useful in the diagnosis, treatment and prevention of Mycobacterium infection. The fusion proteins and the polynucleotides are useful as diagnosit cools in patients infected with Mycobacterium, in vitro and in vivo assays for detecting humoral antibodies or cell-mediated immunity against M. tuberculosis, for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Composition comprising MTB39 antigen and MTB32A antigen from Mycobacterium species, useful for eliciting immune response in a subject

Claim 1; Fig 9; 62pp; English

WPI; 1999-601610/51 N-PSDB; AAZ20200 New fusion proteins of Mycobacterium tuberculosis antigens, useful for diagnosing, treating or preventing M. tuberculosis infection, particularly as vaccine for treating or preventing tuberculosis.

The invention relates to a purified polypeptide which induces an immune response of Mycobacterium tuberculosis. Polypeptides of the invention are useful for diagnosing, treating or preventing M. tuberculosis infection, particularly tuberculosis infection. In particular, the polypeptides are useful as a vaccine formulation with an adjuvant to afford long-term protection in animals against the development of tuberculosis. The protein coding sequence may be used to encode a protein product for use as an immunogen to induce and/or enhance an immune response to M. tuberculosis. This sequence represents an M. tuberculosis fusion protein of the invention. Claim 1; Fig 7A-B; 83pp; English

```
This sequence represents a recombinant Mycobacterium tuberculosis tetra-
antigen fusion protein, termed Mtb46f, composed of the antigens BRD14,
DPV, MTI and MSL. The fusion protein is expressed in host cells using a
vector carrying a polynuclectie (see AAZ2020) comprising the coding
sequences for the 4 antigens. The invention provides fusion proteins
sequences for the 4 antigens. The invention provides fusion proteins
fusion proteins and polynuclectides encoding them are useful as vaccines
for preventing tuberculosis (claimed), for diagnosis (via in vitro assays
or intradermal skin tests for detection of anti-M. tuberculosis
antibodies), monitoring of disease progression, and treatment of
tuberculosis. They are more effective immunogens than mixtures of the
individual protein components
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ouery Match

Sequence 109 Application US/09073009

Patent No. 6555653

Patent No. 6555653

APPLICANT: Alderson, Mark
APPLICANT: Dillon, Davin C.
APPLICANT: Skeiky, Yasir A.W.
APPLICANT: Campos.Nato, Antonio
TITLE OF INVENTION: COMPOUNDS AND DIAGNOSIS OF
NUMBER OF SEQUENCES: 144
CORRESPONDENCE ADDRESS:
ADDRESSEE: SEED and BERRY
STREET: Gastle
STATE: Washington
COUNTRY: Seatile
STATE: Washington
COUNTRY: US
ZIP: Mashington
COUNTRY: US
ZIP: Path NORM: PC-COMPAINE
COMPUTER READBLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: PatentIn Release #1.0, Version #1.30

TUBERCULOSIS
APPLICANT: Houghton, Raymond
APPLICANT: Houghton, Raymond
APPLICANT: Vedvick, Thomsel R.
TITLE OF INVENTION: COMPOUNDS AND METHODS FOR DIAGNOSIS OF TUNDEBRE OF SEQUENCES: 148
NUMBER OF SEQUENCES: 148
CORRESPONDENCE ADDRESS;
ADDRESSE: SEED and BERRY LLP
STREET: 6300 Columbia Center, 701 Fifth Avenue
STREET: Mashington
COUNTRY: Washington
ZIP: 98104-7092
ZIP: 98104-7092
ZIP: 98104-7092

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Sequence of a 189-kb segment of the chromosome of Rhodobacter
                                                                         phosphate.
--- PATHAAX: Galactose metabolism; first step.
--- SUBCELLULAR LOCATION: Cytoplasmic (Potential).
--- SIMILARITY: Belongs to the GHMP kinase family.
Nature 406:477-483(2000).
-!- CATALYTIC ACTIVITY: ATP + D-galactose = ADP + D-galactose 1-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Rhodobacter capsulatus (Rhodopseudomonas capsulata).

Hendrix R.W. Duda R.L.;
Hendrix R.W. Duda PaPa: not the mother of all lambda phages.";
Science 258:1145-1148(1992)

-!- MISCELLANEOUS: The common laboratory strain of bacteriophage
lambda; lambda PaPa; carries a frameshift mutation relative to Ur-
lambda, the original isolate: The Ur-lambda virions have thin,
jointed tail fibers (side tail fibers) that are absent from lambda
wild type. Relative to lambda PaPa, Ur-lambda has expanded
receptor specificity and adsorbs to E.coli cells more rapidly.
-!- SIMILARITY: Belongs to the tail fiber family.
-!- CAUTION: This is a conceptual translation; a frameshift was
corrected in position to 396 to recreate the original stf protein.
